

One way that the Data Analytics module is integrated with the rest of the game is through the tracking of player statistics. Currently, the two stats that we are tracking using our AnalyticsManager class are damage dealt to enemies, and enemies killed, but the way our module's classes are set up allow for very easy expansion to include more stats as necessary. Player stats are tracked on a per-run basis, a run being a single playthrough of the game. This means that for the sake of cumulative stats, such as average, we'll display, for example, the average damage the player deals per run, and for comparative stats, like max or min, we'll display the maximum damage the player dealt in a run, or the fewest enemies they killed during any run. These stats are then displayed in the statistics page found in the game menu using a dashboard snapshot created by the StatsTracker class, which turns all the accumulated data into an easy to handle struct, which is used to extract the requested data points for display. Additionally, we keep track of the amount of actions that are taken by agents in the world. Currently, however, this keeps track of all agents, not just the player, so it is constantly increasing as the enemies move around the world.
